Neural Mechanisms of a Genome-Wide Supported Psychosis Variant

For over a century, disturbed interactions between brain areas have been proposed to underlie schizophrenia (1). Extensive work in patients (1, 2) has demonstrated abnormal coupling between structures implicated in schizophrenia, dorsolateral prefrontal cortex (DLPFC) and hippocampal formation (HF), but the relevance for heritable risk was unclear. Through genome-wide association

Conversely, the HF was uncoupled from DLPFC in non-risk-allele homozygotes but showed dose-dependent increased connectivity in risk-allele carriers. Lastly, the risk allele predicted extensive increases of connectivity from amygdala (Fig. 1D and table S2), including to hippocampus, orbitofrontal cortex, and medial prefrontal cortex. Rs1344706 genotype had no impact on performance

netic mechanism, where reduced DLPFC connectivity could contribute to disturbed executive function (1) and increased coupling with HF to deficient interactions between prefrontal and limbic structures (2). Because amygdala connectivity is not implicated in genetic risk for schizophrenia (6), the observed effects on limbic connectivity might relate to bipolar disorder, where increased connectivity of amygdala has been observed and could contribute to emotional instability. More generally, our findings show that rs1344706, or genetic variant(s) in linkage disequilibrium (i.e., variants that are nonrandomly related), is functional in human brain. The molecular changes leading up to altered neural systems function remain to be elucidated. We speculate that, because genetic variation in dopaminergic and glutamatergic neurotransmission affects DLPFC or HF connectivity (4), examination of ZNF804A in those neurotransmitter

Frequency of Crisis Narrative in Web of Science Records

Daniele Fanelli PNAS 2018 ;115:11:2628-2631

Number of Web of Science records that in the title, abstract, or keywords contain one of the following phrases: “reproducibility crisis,” “scientific crisis,” “science in crisis,” “crisis in science,” “replication crisis,” “replicability crisis.” ...

Reproducibility crisis became (not equally) recognized

Baker, *Nature*, 2016, <https://www.nature.com/news/1-500-scientists-lift-the-lid-on-reproducibility-1.19970>

The context of the crisis...

Competitive, flexible, and insecure work environment

Forschung und Lehre (2012)

In 2023 90% of the early career personnel in German higher education with fixed-term contracts

BuWik (2025)

- 98% in <35 years of age
- 77% between 35-45 years of age
- Ø 22 months contract duration PhDs
- Ø 28 months contract duration PostDocs

BuWin (2021)

67% of the full-time personnel in German research and higher education were employed on fixed-term contracts in 2022.

https://www.destatis.de/DE/Presse/Pressemitteilungen/2023/10/PD23_397_213.html

Competitive, flexible, and insecure work environment

Better working conditions might contribute to more reproducible i.e. “higher quality” research (Rahal et al. 2023)

- Extreme competitiveness specifically for senior or tenured positions
- High-turnover disrupts long-term perspectives and results in loss of expertise
- Biases in selection procedures
- Focus on specific measures achievable in short-term leads to misaligned incentives:
 1. “Quality” publications
 2. Third-party funding

Publish or perish...

What's best for science?

High quality research,
regardless of outcome.

*Highly reproducible research,

Use of the Journal Impact Factor in academic review, promotion, and tenure evaluations

Abstract We analyzed how often and in what ways the Journal Impact Factor (JIF) is currently used in review, promotion, and tenure (RPT) documents of a representative sample of universities from the United States and Canada. 40% of research-intensive institutions and 18% of master's institutions mentioned the JIF, or closely related terms. Of the institutions that mentioned the JIF, 87% supported its use in at least one of their RPT documents, 13% expressed caution about its use, and none heavily criticized it or prohibited its use. Furthermore, 63% of institutions that mentioned the JIF associated the metric with quality, 40% with impact, importance, or significance, and 20% with prestige, reputation, or status. We conclude that use of the JIF is encouraged in RPT evaluations, especially at research-intensive universities, and that there is work to be done to avoid the potential misuse of metrics like the JIF.

Retrieval induces adaptive forgetting of competing memories via cortical pattern suppression

Remembering a past experience can, surprisingly, cause forgetting. Forgetting arises when other competing traces interfere with retrieval and inhibitory control mechanisms are engaged to suppress the distraction they cause. This form of forgetting is considered to be adaptive because it reduces future interference. The effect of this proposed inhibition process on competing memories has, however, never been observed, as behavioral methods are 'blind' to retrieval dynamics and neuroimaging methods have not isolated retrieval of individual memories. We developed a canonical template tracking method to quantify the activation state of individual target memories and competitors during retrieval. This method revealed that repeatedly retrieving target memories suppressed cortical patterns unique to competitors. Pattern suppression was related to engagement of prefrontal regions that have been implicated in resolving retrieval competition and, critically, predicted later forgetting. Thus, our findings demonstrate a cortical pattern suppression mechanism through which remembering adaptively shapes which aspects of our past remain accessible.

Probabilistic word pre-activation during language comprehension inferred from electrical brain activity

Despite the numerous examples of anticipatory cognitive processes at micro and macro levels in many animal species, the idea that anticipation of specific words plays an integral role in real-time language processing has been contentious. Here we exploited a phonological regularity of English indefinite articles ('an' precedes nouns beginning with vowel sounds, whereas 'a' precedes nouns beginning with consonant sounds) in combination with event-related brain potential recordings from the human scalp to show that readers' brains can pre-activate individual words in a graded fashion to a degree that can be estimated from the probability that each word is given as a continuation for a sentence fragment offline. These findings are evidence that readers use the words in a sentence (as cues to their world knowledge) to estimate relative likelihoods for upcoming words.

Retraction Watch

Tracking retractions as a window into the scientific process

Nature says it wants to publish replication attempts. So what happened when a group of authors submitted one to Nature Neuroscience?

Over the past few years, Nature has published editorials extolling the virtues of replication, concluding in *one* that "We welcome, and will be glad to help disseminate, results that explore the validity of key publications, including our own."

Mante Nieuwland, of the Max Planck Institute for Psycholinguistics, and colleagues were encouraged by that message, and submitted one such replication attempt to Nature Neuroscience. In a three-part guest post, Nieuwland will describe what happened when they did, and discusses whether reality lives up to the rhetoric.

Political Attitudes Vary with Physiological Traits

Although political views have been thought to arise largely from individuals' experiences, recent research suggests that they may have a biological basis. We present evidence that variations in political attitudes correlate with physiological traits. In a group of 46 adult participants with strong political beliefs, individuals with measurably lower physical sensitivities to sudden noises and threatening visual images were more likely to support foreign aid, liberal immigration policies, pacifism, and gun control, whereas individuals displaying measurably higher physiological reactions to those same stimuli were more likely to favor defense spending, capital punishment, patriotism, and the Iraq War. Thus, the degree to which individuals are physiologically responsive to threat appears to indicate the degree to which they advocate policies that protect the existing social structure from both external (outgroup) and internal (norm-violator) threats.

Conservatives and Liberals have Similar Physiological Responses to Threats: Evidence from Three Replications

Bert N. Bakker,^{1*} Gijs Schumacher,² Claire Gothreau,³ Kevin Arceneaux⁴

2019, 10.31234/osf.io/vdpyt

Conservatives and liberals have similar physiological responses to threats

Bert N. Bakker^{1*}, Gijs Schumacher², Claire Gothreau³ and Kevin Arceneaux⁴

About a decade ago, a study documented that conservatives have stronger physiological responses to threatening stimuli than liberals. This work launched an approach aimed at uncovering the biological roots of ideology. Despite wide-ranging scientific and popular impact, independent laboratories have not replicated the study. We conducted a pre-registered direct replication ($n=202$) and conceptual replications in the United States ($n=352$) and the Netherlands ($n=81$). Our analyses do not support the conclusions of the original study, nor do we find evidence for broader claims regarding the effect of disgust and the existence of a physiological trait. Rather than studying unconscious responses as the real predispositions, alignment between conscious and unconscious responses promises deeper insights into the emotional roots of ideology.

2022

Higher impact factor publications...

1. ...are used as selection criteria for senior positions and receiving tenure.
2. ...lead to more funding from institutions.
3. ...increase competitiveness in grant applications.

Revising grant-based funding to improve “quality”

Rahal et al. (2023) <https://doi.org/10.1038/s41562-022-01508-2>

Third-party funding: A flawed cornerstone

Background on TPF

- OECD countries currently allocate around 2.7% of their GDP to scientific research in higher education – approximately 1.7\$ trillion p.a.
- 28% of the total German research budget was distributed through competitive TPF in 2022
- TPF is implemented as critical instrument for steering and quality control

Criticism of current TPF models

- Significant investment on top of doing “actual” science
- Errors and biases in review process
- Entry-biases for applications
- Low success rates with extremes as low as 7%
- Significant societal (sunk) costs

Comment

<https://doi.org/10.1038/s41562-023-01649-y>

Rethink funding by putting the lottery first

#RethinkFunding: primary data on a lottery-first approach

Stiftung
Innovation in der
Hochschullehre

- €300 million budget p.a. from BMBF for (managing) different funding lines in German higher education
- “Freiraum”: €50 million funding for the implementation and evaluation of ideas for enhancing teaching practices ~150 projects funded
 - >280.000 people working in German institutions eligible for funding
 - Aim for reducing costs both at the foundation and for the academic workforce

#RethinkFunding: primary data on a lottery-first approach

financial costs
reduced by 68%
and sunk costs by
a factor of ~27

“When we believe that we will be judged by silly criteria we will adapt and behave in silly ways.”

- Systematic issues in the organization of the academic workforce sets the context for the “quality” of our research
- Motivating behaviour through journal-based metrics is dysfunctional for reproducibility efforts
- Structure of grant-based funding can be changed and should be reconsidered

Thank you...
