

HERMES Kickoff Workshop 2021-11-12

Powering open science and collaboration with Invenio

HERMES Kick-off Workshop

Northwestern University Invenio Team

November 12, 2021

Invenio software powers open science

Free Open Source Software

Invenio is Free Open Source Software supported by a committed community of multidisciplinary institutions.

[Code](#) | [Docs](#) | [Examples](#)

Friendly and Responsive Community

Although Invenio was born at CERN, its community is growing bigger every day. Talk to the team now in our chatroom or forum.

[Chatroom](#) | [Forum](#) | [Get Involved](#) | [Events](#)

The "Safe bet"

Invenio community has been around for 20 years. [Solid services](#) have been built on top of it to ensure long-term confidence.

[Live services](#) | [Products](#)

How did this collaboration start (and what about Zenodo?!)

What motivated the InvenioRDM project?

- Some organizations tried to reuse the existing open source Zenodo source code
- Other orgs tried to use the Invenio Framework to build a RDM repository from scratch
- Several orgs tried to make the same modifications but had no easy way of sharing their changes

All these groups came together to create a collaborative open source project and grow a sustainable community.

Zenodo will also run on InvenioRDM by the end of the project period.

We're leveraging Invenio as a strong foundation. Here's why.

RDM platforms
are critical to help
preserve and share
research, enable
reproducibility, and
empower reuse of
datasets, protocols,
engagement or
study materials, &
a wide range of
other research
products.

- **Research, shared.** Securely share and preserve data records and a wide range of research types with collaborators. Allows easy dissemination to the community.
- **Discoverable.** Leverages metadata standards and the powerful Elasticsearch full-text search engine retrieves, facets, sorts, and filters your searches with ease.
- **Scalable.** Invenio is fast. Designed to manage 100+ million records and petabytes of files. All data can be archived independently of the size.
- **Communities.** Create and curate your own community (e.g., workshop, project, lab, or journal).
- A robust community: Large team of developers & active open source community. A SAAS-model for service via TIND (CERN spinoff). Invenio is widely used by [many organizations](#) & underlying technology (Python, Flask) widely supported.
- **Next-Generation:** With InvenioRDM, any organization can launch a turn-key open source next-generation repository platform with world-class features to support open and FAIR science. <http://ngr.coar-repositories.org/>
- **Get credit & be cited.** Get a DOI to make records easily and uniquely citable. Pre-formatted citation text makes it easy to cite your work and be cited. Contributor roles allow you to recognize the whole team.
- **Metrics.** Industry standard usage statistics for record pages with all tracking completely anonymized.
- **FAIR.** Advanced features to make your research Findable, Accessible, Interoperable, & Reusable.
- **Compliance-friendly.** Comply with data sharing mandates* and acknowledge your funders.
- **Easy.** Turn-key research data management platform & index can be easily deployed in the local environment by your team or by a service provider, such as TIND. Customize the look and feel to your local environment.

The InvenioRDM project has two goals:

Repository Platform

Build a turn-key research data management (RDM) repository platform based on [Invenio Framework](#) and [Zenodo](#).

Community

Grow a community of research institutions, private companies and individuals to sustain the platform going forward.

The platform

A few highlights...

InvenioRDM stack

Elasticsearch

Elasticsearch is an extremely fast JSON-native distributed search engine supporting anything from full-text to geospatial queries.

PostgreSQL or MySQL

PostgreSQL and **MySQL** are powerful relational databases with JSON-support as well as a strong reputation for reliability, robustness, and performance.

Python/Flask

Invenio is built using **Python 3**, the **Flask** micro web framework and a suite of the best community-built Python libraries.

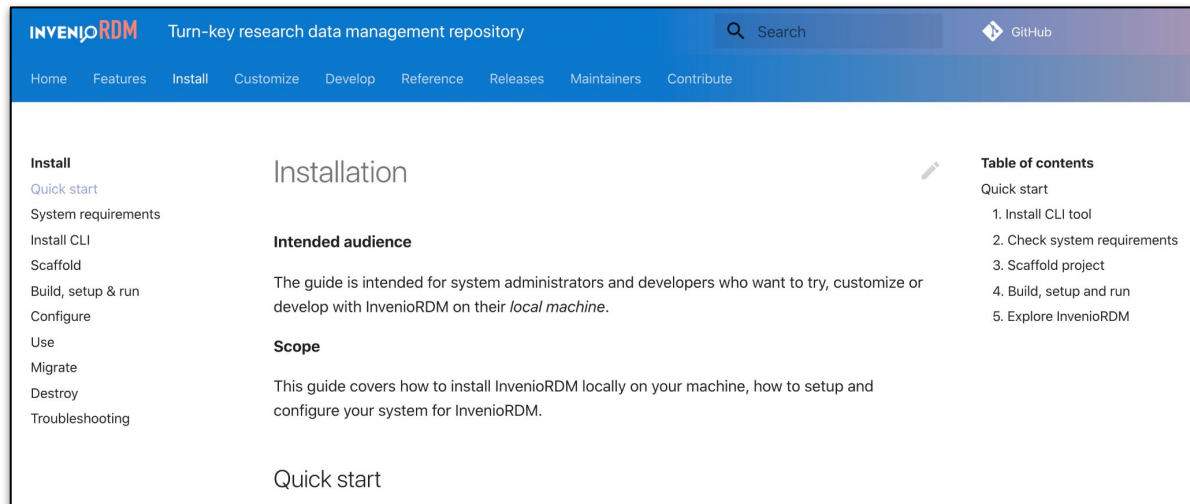

React

InvenioIIS UIs are built using **React**, the well-known JavaScript library.

Invenio is JSON-native and provides RESTful APIs to make it easy to build apps on top of the framework

Standing up InvenioRDM

- 1- Install invenio-cli
`pip install invenio-cli`
- 2- Initialize your project
`invenio-cli init`
`cd <project name>`
- 3- Install it and run it
`invenio-cli install`
`invenio-cli services setup`
`invenio-cli run`
- 4- Visit `https://localhost`
`firefox https://127.0.0.1:5000`

System requirements

Invenio can run in Docker, on virtual machines, or on physical machines. Invenio can run on a single machine or a cluster of 100s of machines.

It all depends on exactly how much data you are handling and your performance requirements.

Small installation:

- Web/app/background servers and Redis: 1 node
- Database: 1 node
- Elasticsearch: 1 node

Medium installation:

- Load balancer: 1 node
- Web/app servers and background workers: 2 nodes
- Database: 1 node
- Elasticsearch: 3 nodes
- Redis/RabbitMQ: 1 node

Large installation:

- Load balancer: 2 node (with DNS load balancing)
- Web/app servers: 3+ nodes
- Background workers: 3+ nodes
- Database: 2 nodes (master/slave)
- Elasticsearch: 5 nodes (3 data, 2 clients)
- Redis: 3 nodes (HA setup)
- RabbitMQ: 2 nodes (HA setup)

Search and retrieve datasets using standards-based documentation

Robust search enhanced by:

- Standardized forms of name (LDAP + ORCID coming soon)
- Standard subject terms (MeSH, Library of Congress Subject terms)
- Standardized citation formats
- Clear levels of access
- Standard application of licenses

The screenshot displays the InvenioRDM @ Northwestern University search interface. The main search bar contains the term "diabetes", and the results show two datasets. A modal window is open, allowing the user to add standardized subject terms to the search.

Hyperglycemia and Adverse Pregnancy Study (HAPO) dataset [Open Access](#)

Metzger, Boyd; Lowe, Lynn P.; Dyer, Alan R.

HAPO aim to assess the association between maternal glucose levels and the adverse outcome of mothers diagnosed with gestational diabetes mellitus (GDM). 25,000 pregnant women from 15 clinics across 9 countries were enrolled with 21,064 able to complete and participated in the study. Women's course of care throughout pregnancy, glucose tolerance, A1C levels and their outcomes were analyzed for any associations or independent associations to create updated guidelines for diagnosing Gestational Diabetes Mellitus (GDM) based off of the data collected and adopted by WHO.

Methylomics of Prenatal Gestational Diabetes Mellitus (GDM) dataset [Open Access](#)

Hou, Lifang; Hu, Gang; Bacarelli, Andrea; Liu, Lei; Zhang, Wei

Building off of The Tianjin GDM Observational Study in China, this project brings the addition of genetics and lifestyle intervention to make a longitudinal study. Blood samples from both the mother and children are taken to be analyzed for DNA methylation and phenotypes. This analysis investigates the effects GDM and the risks for obesity and cardiometabolic issues that may arise in children as a result of in utero exposure. This project aims to explore the influence of lifestyle choices and intervention with children affected.

Data management for reproducibility and Open Access: study-focused resource types

InvenioRDM helps you store, manage and, if needed, share your study's outputs:

- Study-based resource types to manage a large range of assets
- **Reproducibility** is enhanced: store research proposals, datasets, code
- Be **compliant** with data sharing mandates
- **Cite** and **attribute** the work of all contributors to research
- **Reuse** deposited data or measures from other studies

Communities & Collections

Community: Define your research group or other collaborative unit

Collection: Create multiple Collections under the umbrella of the Community. Within Collections, deposit and describe your:

Phenotype Definitions

Definitions
Characterizations
Evaluations
Metadata
Dissemination Strategy

Clinical Studies

Research Proposals
Protocols
Data Management Plans
Methods Descriptions
Measures
Case Reports
Datasets and Analyses

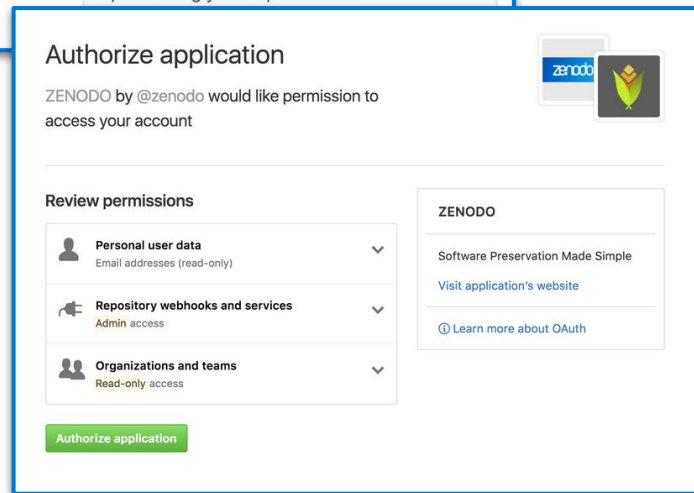

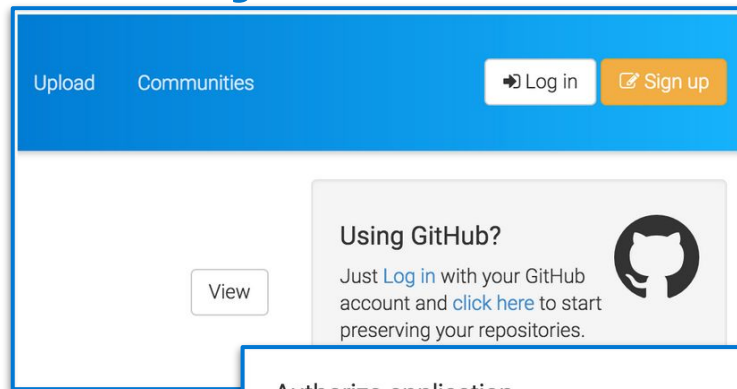

Collections bring together related groupings of documentation to communicate process, enable sharing of results, and support publication, compliance, and reproducibility

The screenshot displays the Zenodo homepage with a header bar containing the values 'Research. Shared.', 'Safe', and 'Citeable. Discoverable.'. Below the header, the 'Popular communities' section features the 'Biodiversity Literature Repository' and two featured collections: 'Phenotype Definitions' (represented by a grid of eyes) and 'XYZ Clinical Study' (represented by a microscope icon). A yellow arrow points from the 'Phenotype Definitions' collection to the 'Phenotype Definitions' section on the right. The 'Popular records' section shows a list of records with a 'This week' filter. The 'New records' and 'Blog posts' sections also display lists of records. The footer includes a 'Funded by' section with logos for CERN, the European Union, and others, and a 'Powered by CERN Data Centre & Invenio' statement.

Software publication and citeability

InvenioRDM will support software publication or deposit in a number of ways, including:

- Generation of citations for all resource types, including software
- Planned support for custom fields which may be necessary to integrate software metadata
- 3rd party integrations allowing a direct link to GitHub, as can currently be seen in Zenodo
 - Login to GitHub from Zenodo
 - Authorize GitHub to give Zenodo needed permissions
 - Pick the repository you want to archive
 - Create a new release

Lesson Open Access

Building Websites with Jekyll and Github/Gitlab: Pre-Alpha test release

Toby Hodges; Aleksandra Nenadic; Julian Karl Bauer; Anne Foullioux; Sarah Stevens; Renato Alves

A (very) pre-alpha release of a lesson teaching the skills required to design, author, and publish web pages with Jekyll and GitHub. The material is nowhere near complete: this release was made to test out the Zenodo/GitHub integration.
