Outline

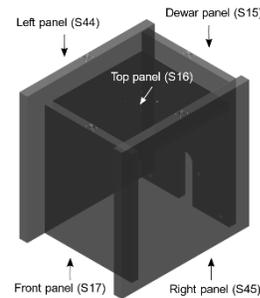

The counting bunker at Felsenkeller

→ HPGe, SAGe Well, SDD, PIPS, LaBr, CeBr, GaGG, CsI, CZT, NaI...

Setup of the new TU1 detector

- Appropriate passive shielding
- Active muon veto

Fun with coincidences

→ How to veto muons in a shallow-underground lab

Felsenkeller shallow underground laboratory

- Located in Dresden/Germany
- 45 m rock overburden (140 m.w.e.)
- 40x less muons, 180x less neutrons, 70x less γ -rays

Passive shielding of TU1

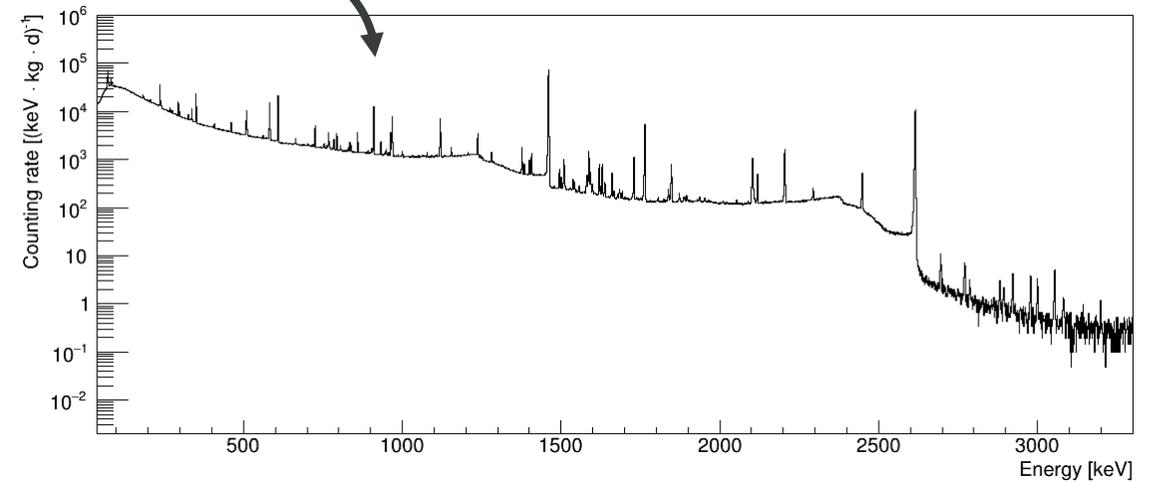

Some numbers for the TU1 detector

- Canberra GX 150-250-R (ULB)
- HPGe with 163% relative efficiency
- Diameter: 90 mm, Length: 90 mm

140 mwe. rock overburden

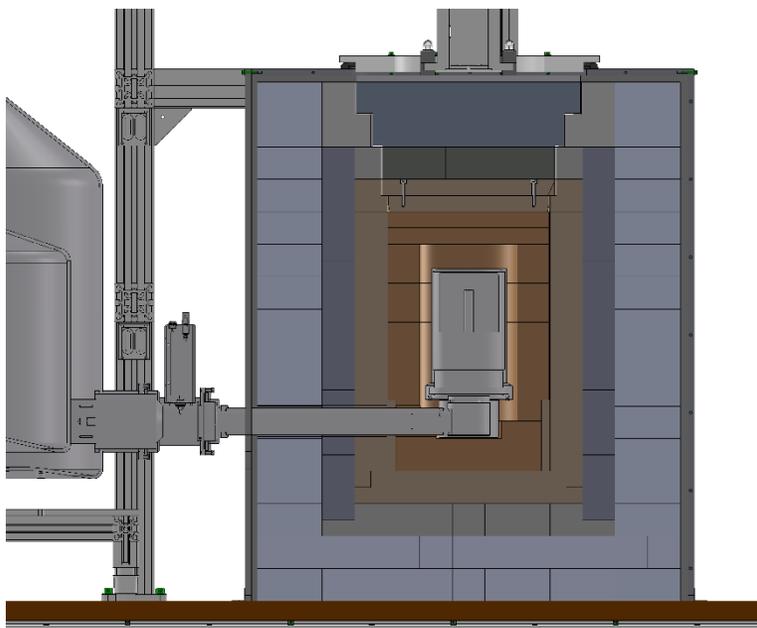

+ 40 cm concrete
(low activity)

Passive shielding of TU1

Some numbers for the TU1 detector

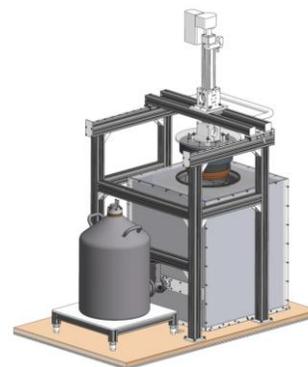

- Canberra GX 150-250-R (ULB)
- HPGe with 163% relative efficiency
- Diameter: 90 mm, Length: 90 mm

+10 cm Pb
(21Bq/kg)

+5 cm Pb
(2.5Bq/kg)

+10 cm OFRP Cu

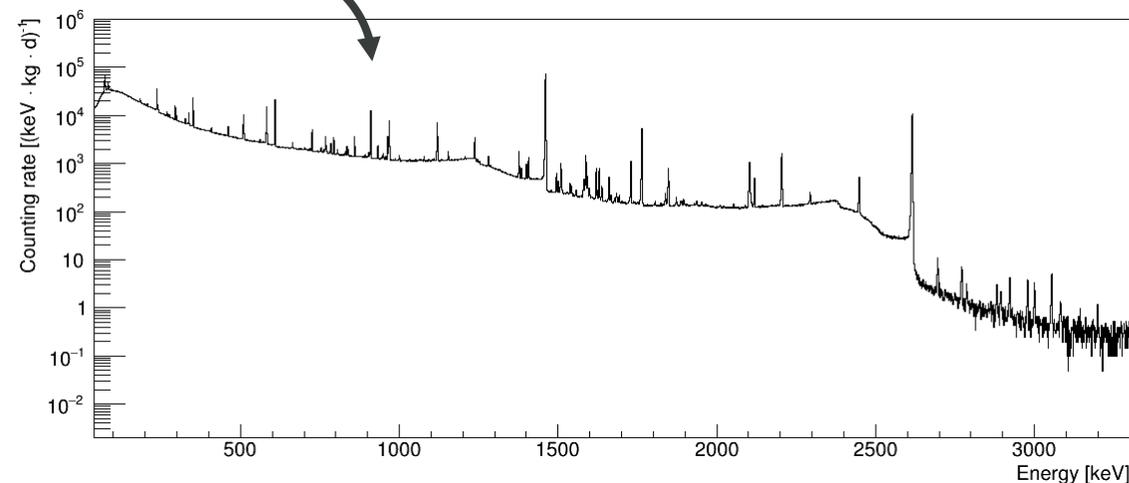

+ Anti radon box

+ 40 cm concrete
(low activity)

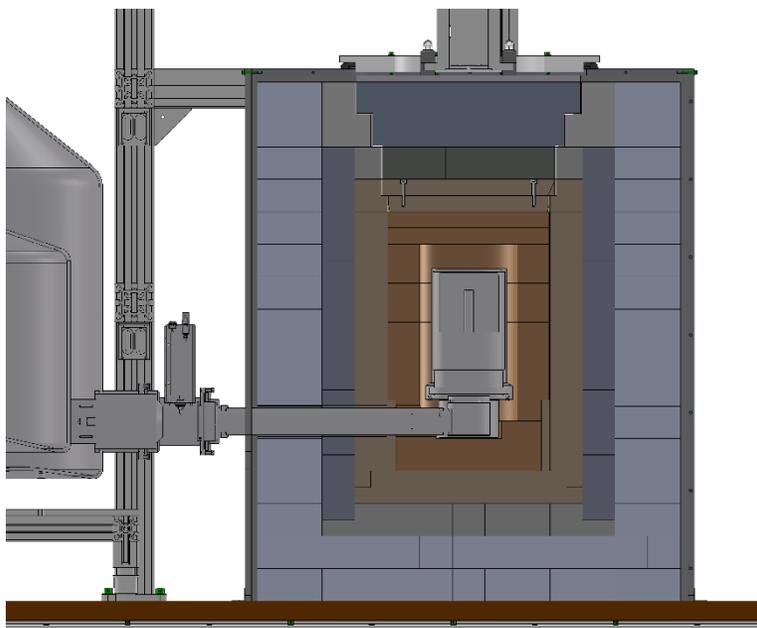

140 mwe. rock overburden

Passive shielding of TU1

Some numbers for the TU1 detector

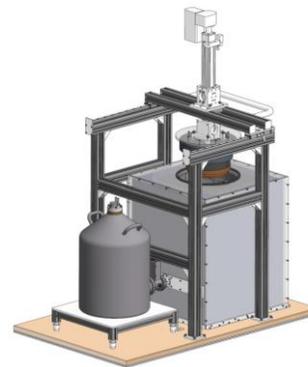

- Canberra GX 150-250-R (ULB)
- HPGe with 163% relative efficiency
- Diameter: 90 mm, Length: 90 mm

+10 cm Pb
(21Bq/kg)

+5 cm Pb
(2.5Bq/kg)

+10 cm OFRP Cu

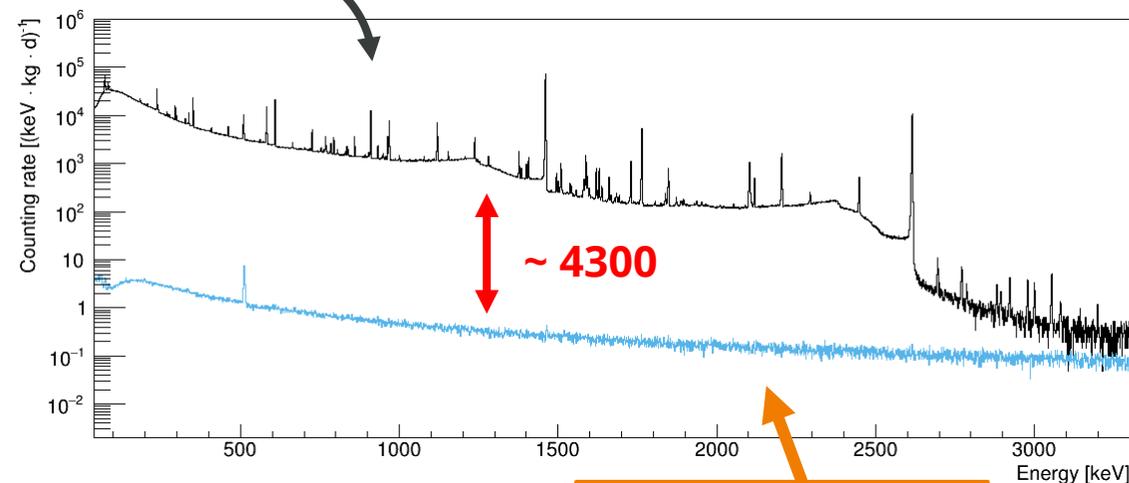

+ Anti radon box

+ 40 cm concrete
(low activity)

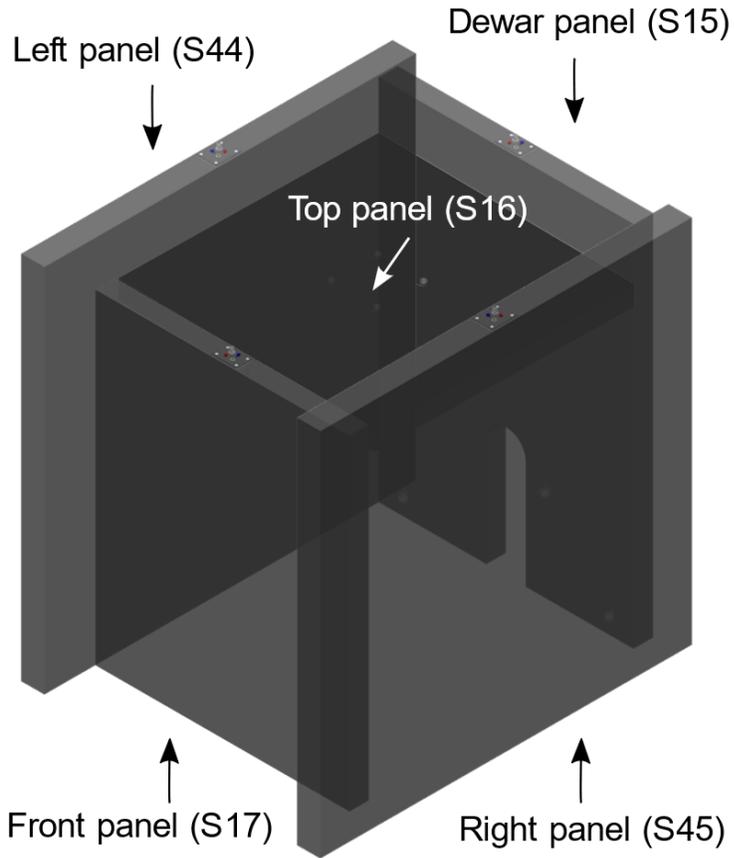

140 mwe. rock overburden

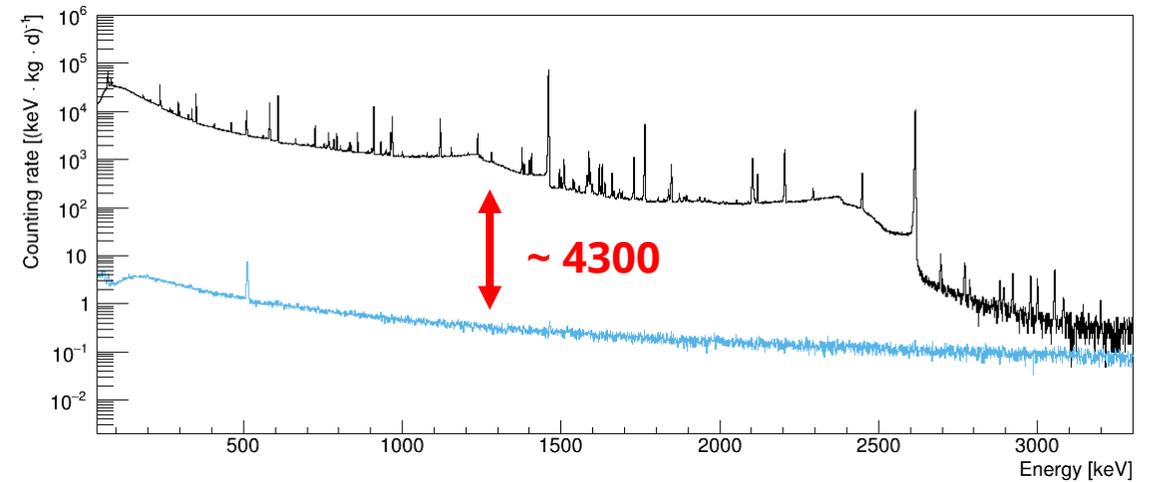

Active shielding of TU1

GIOVE, DLB, GeMSE...

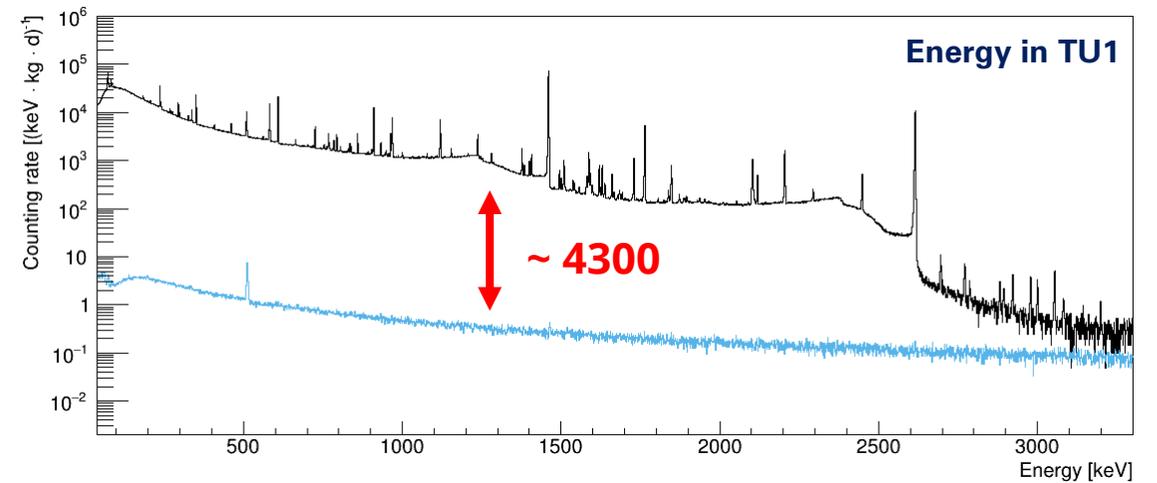

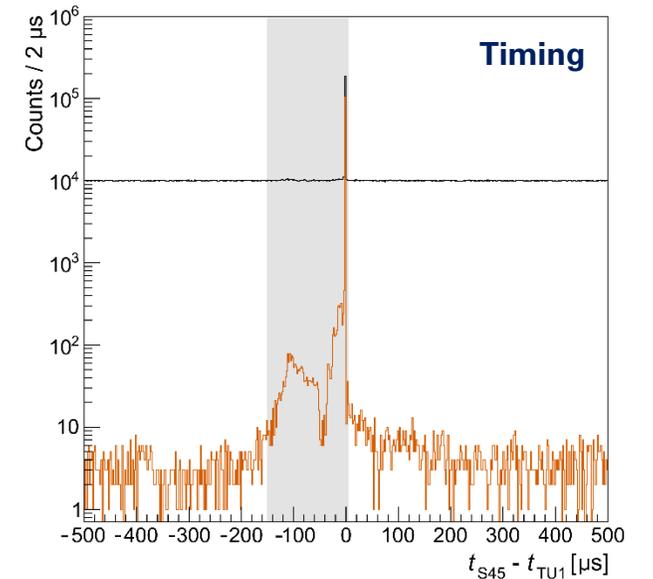

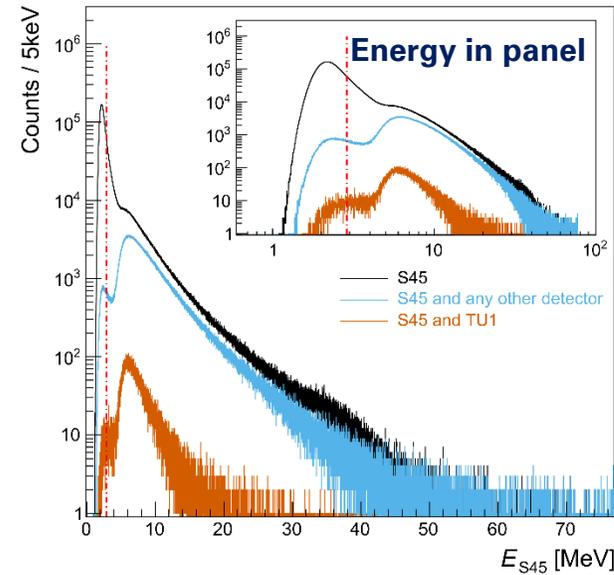

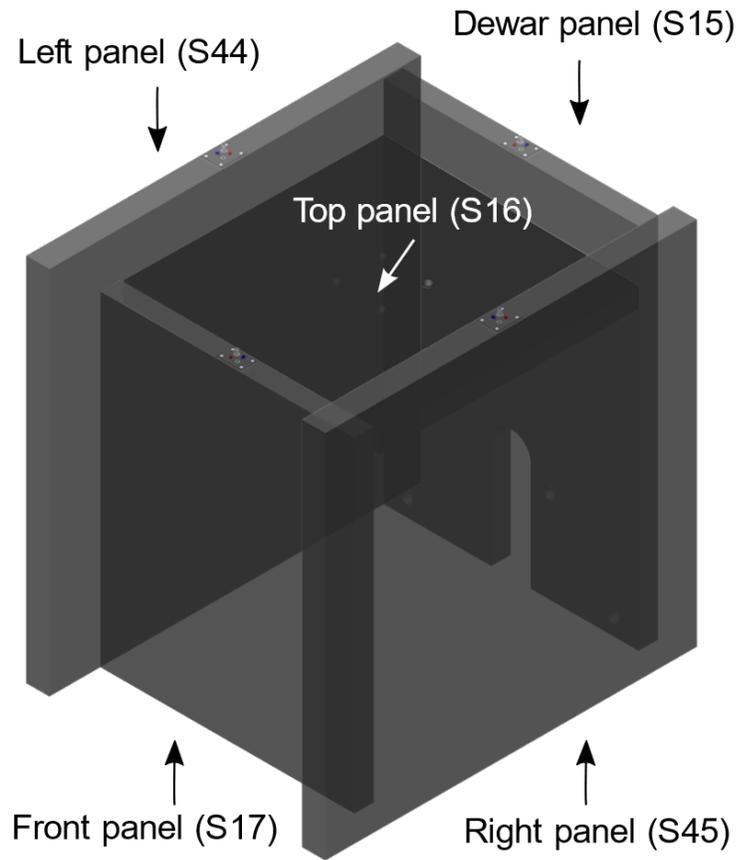

Setup of the active shielding

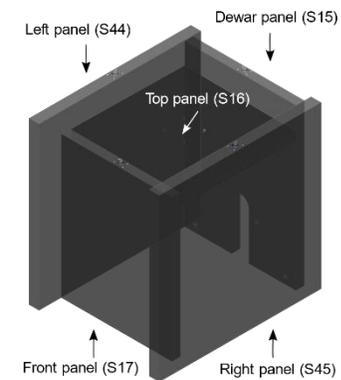

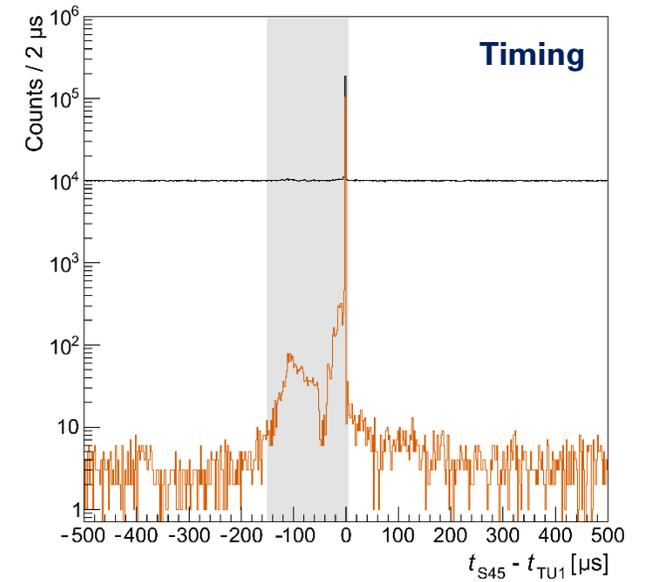

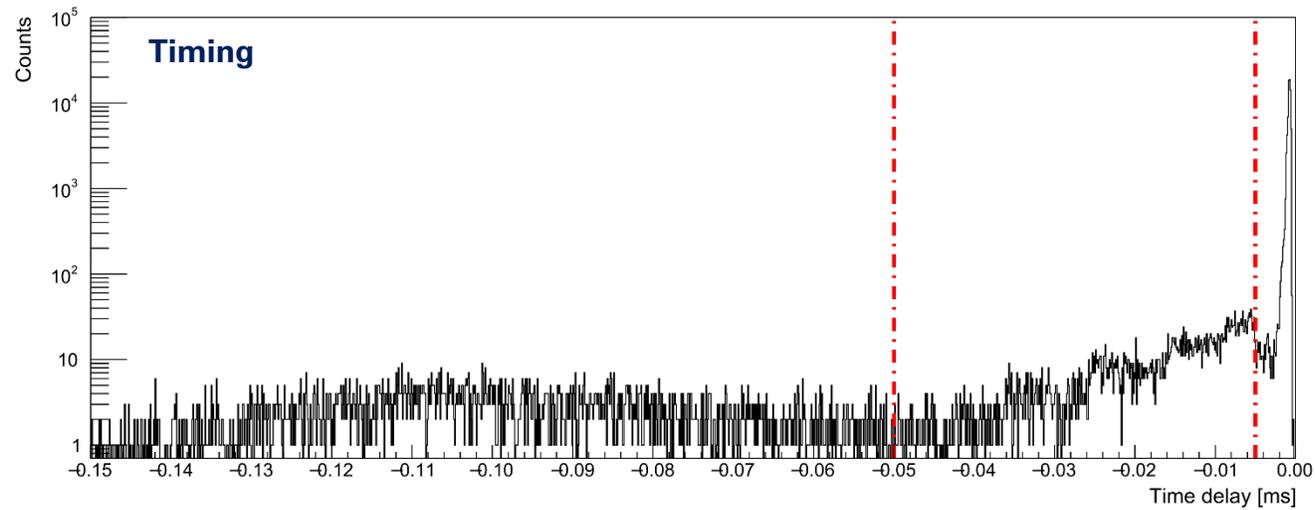

- Five scintillation panels
- Surrounding the passive shield
- **DAQ:** Digitizer with list mode
 - Veto the muon-induced events
 - **Make nice physics with coincidences**

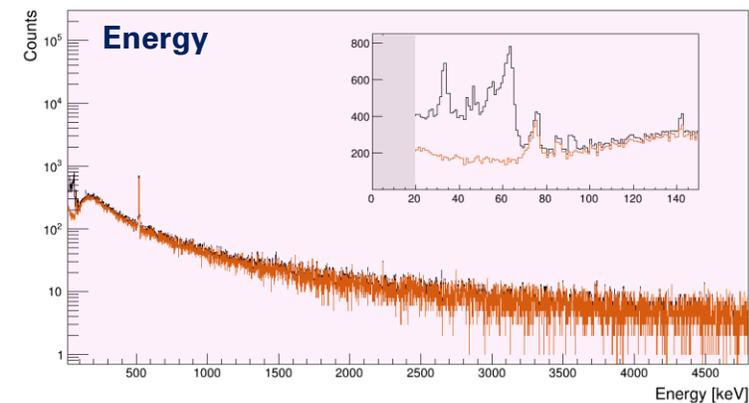

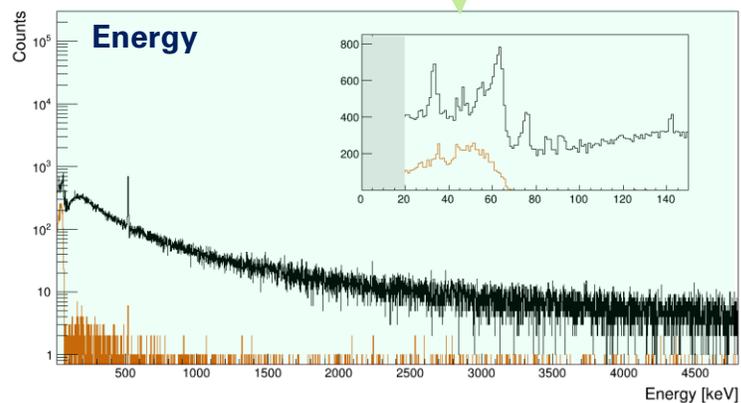

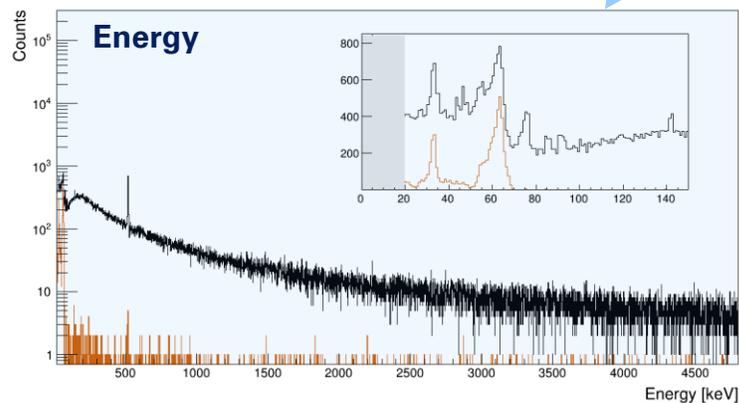

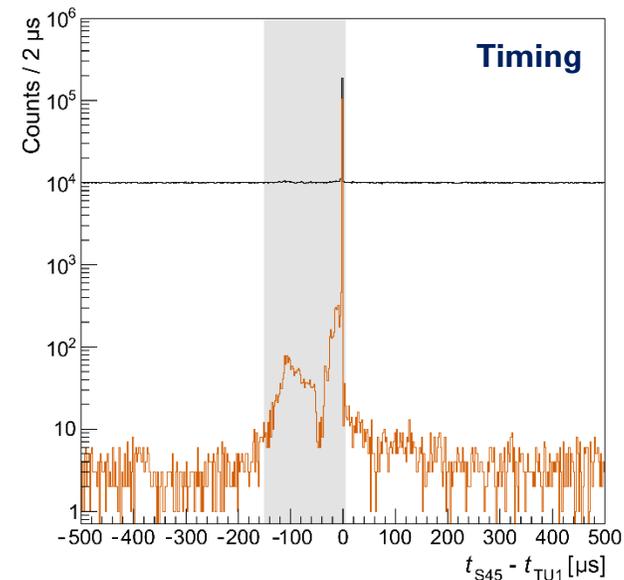

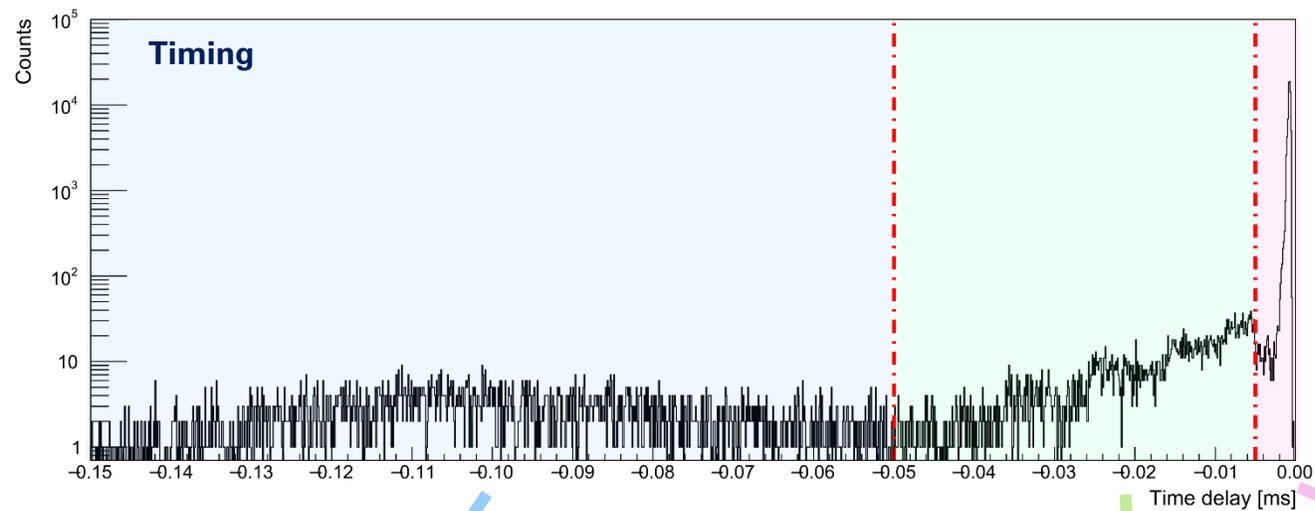

Active shielding of TU1

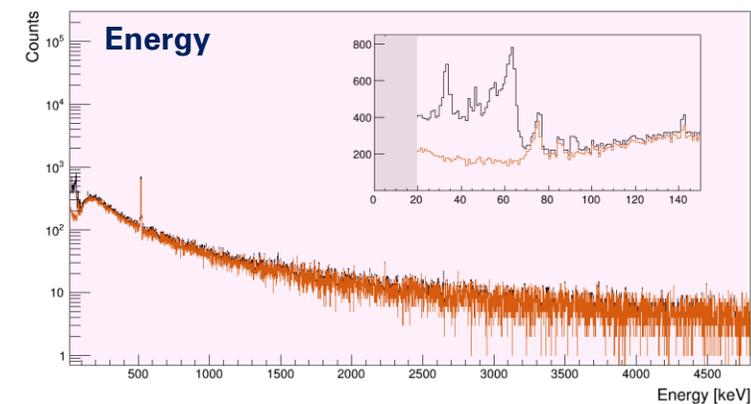

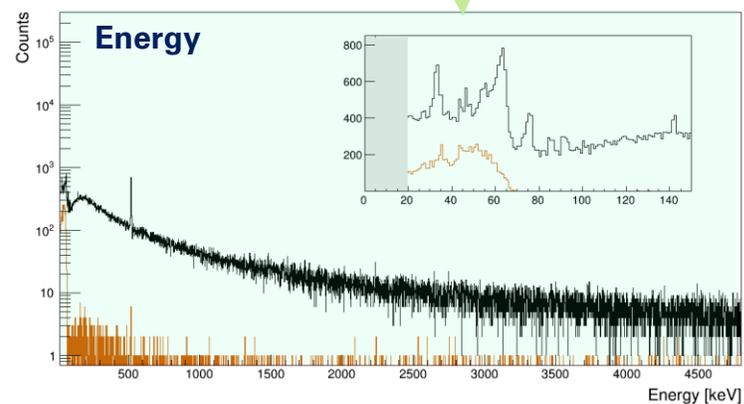

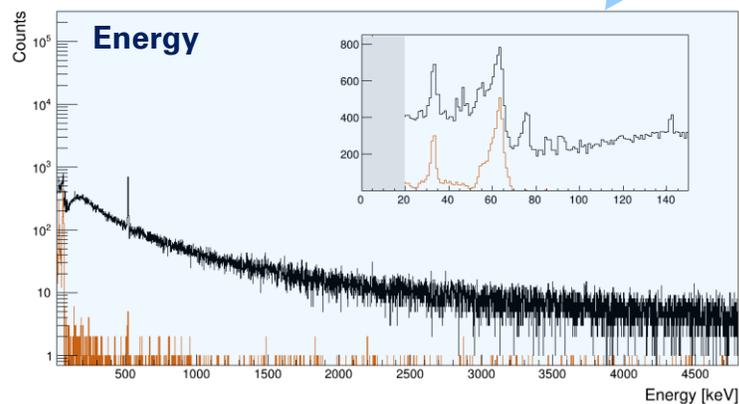

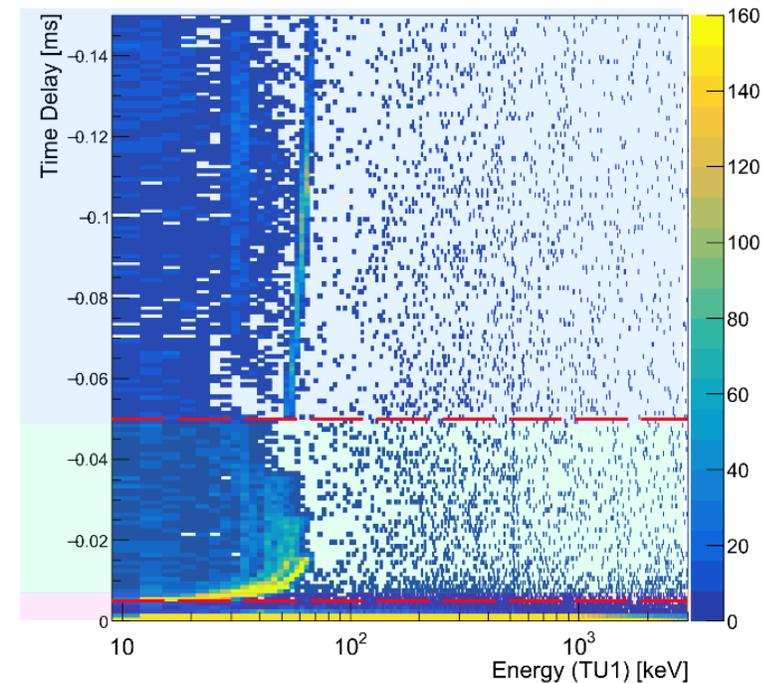

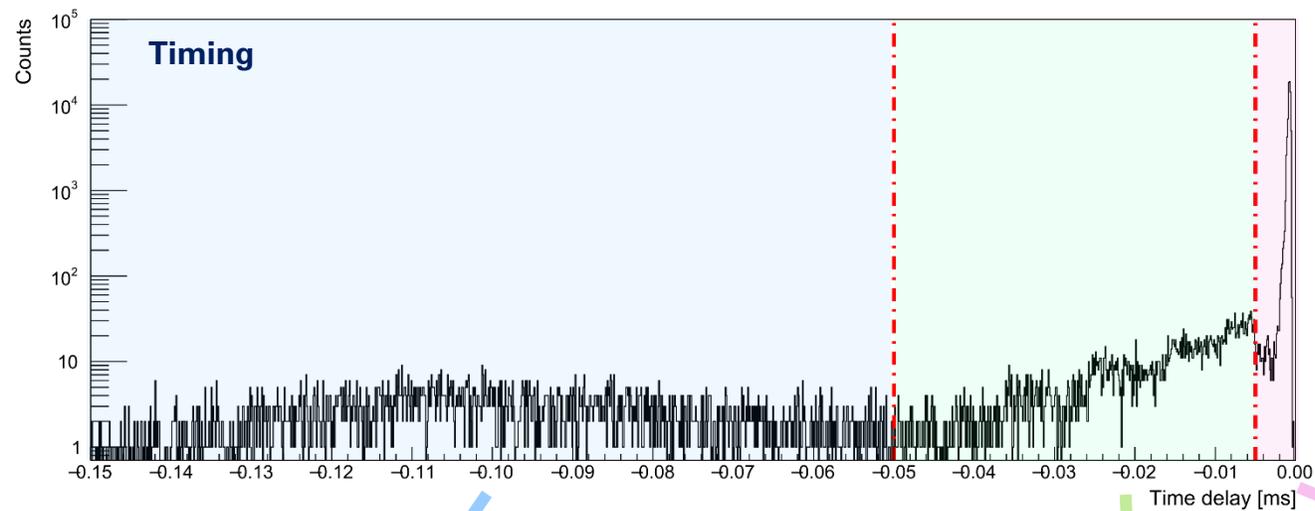

Delayed coincidences

Delayed coincidences

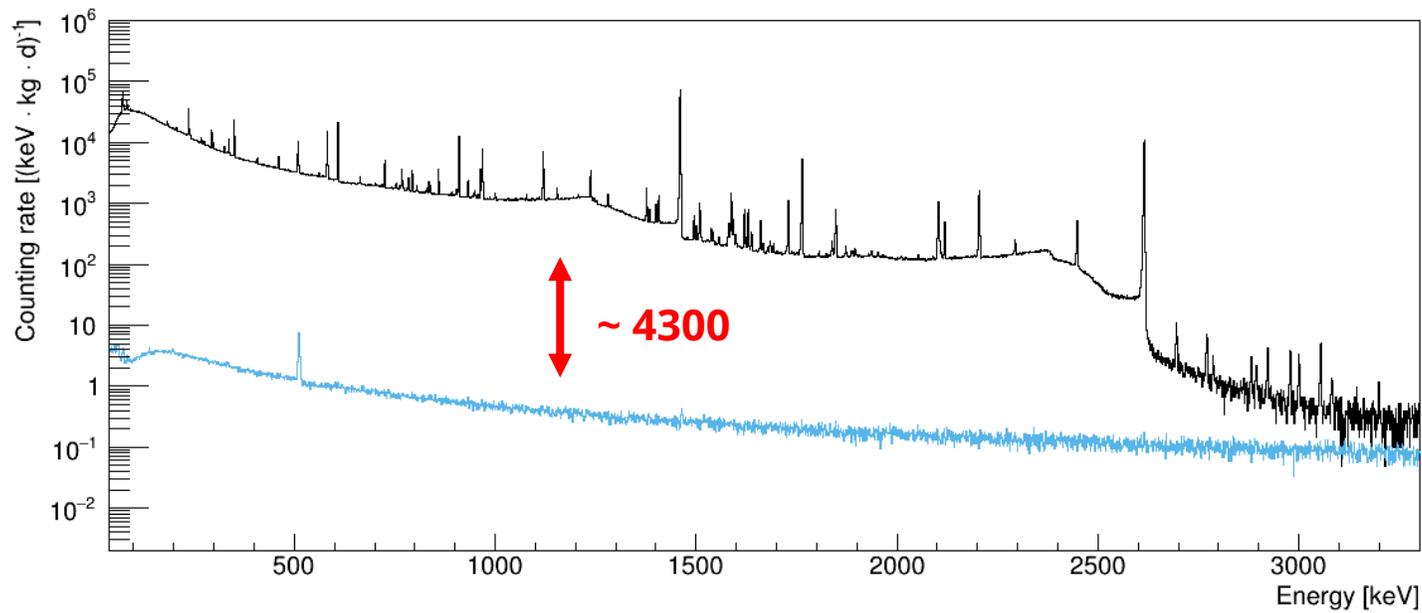

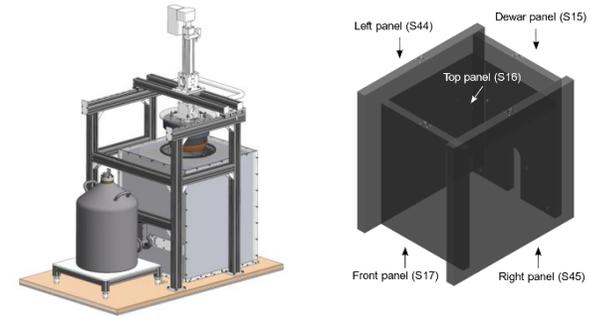

Delayed coincidences

Applying the active veto on TU1

Integrated counting rate [40keV;2700keV]

➤ **Passive:** $R = 1982(3) \text{ kg}^{-1}\text{d}^{-1}$

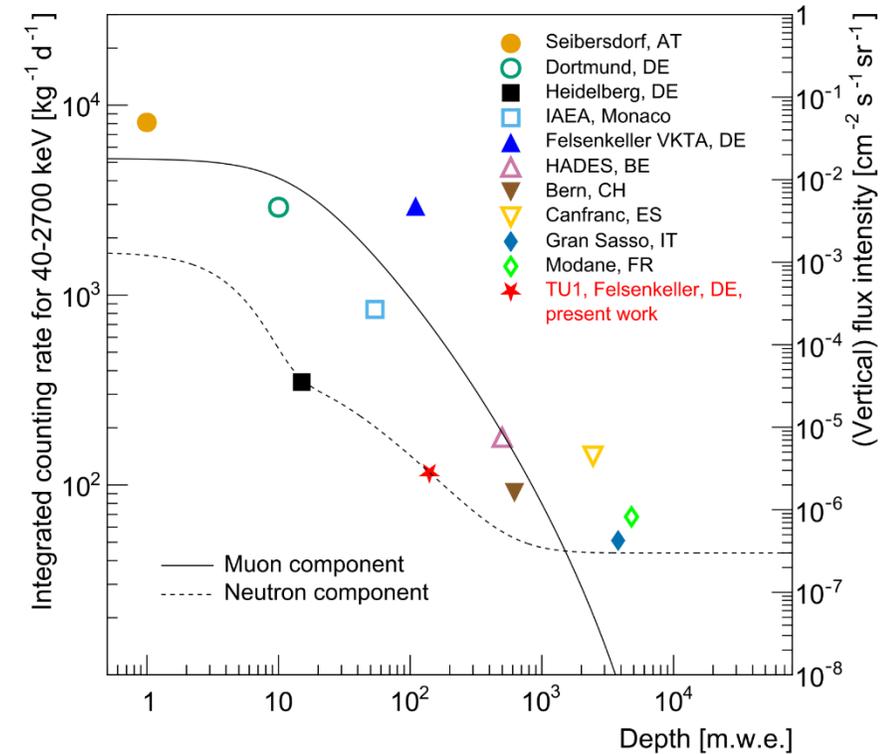

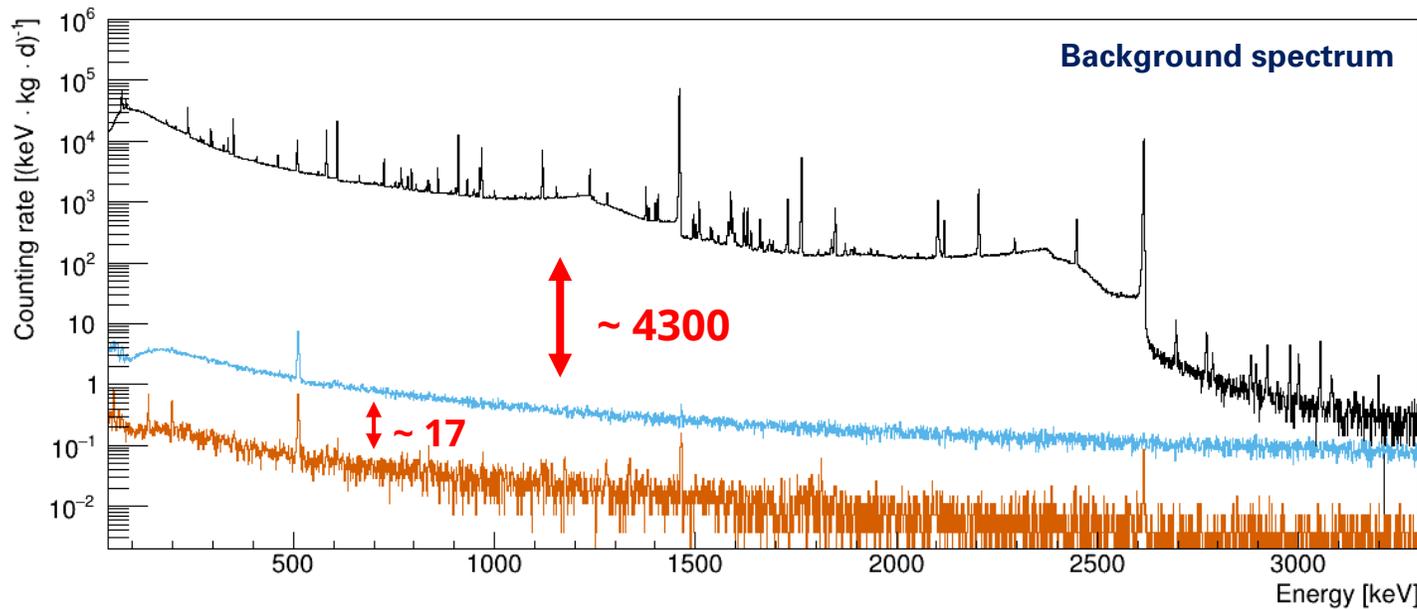

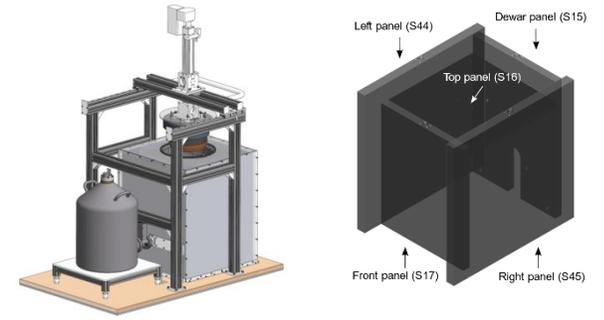

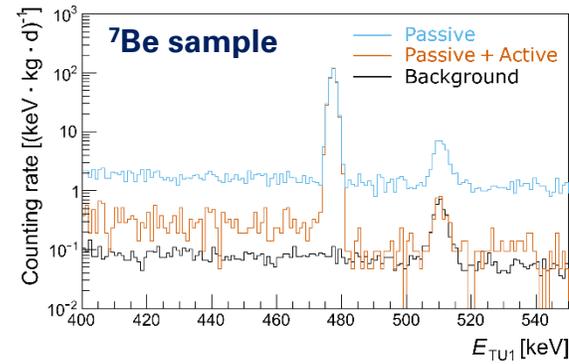

Applying the active veto on TU1

Integrated counting rate [40keV;2700keV]

- **Passive:** $R = 1982(3) \text{ kg}^{-1}\text{d}^{-1}$
- **Passive & active:** $R = 116(1) \text{ kg}^{-1}\text{d}^{-1}$

Veto efficiency of the active veto

- Efficiency: 99.52(19) %

Remaining TU1 spectrum

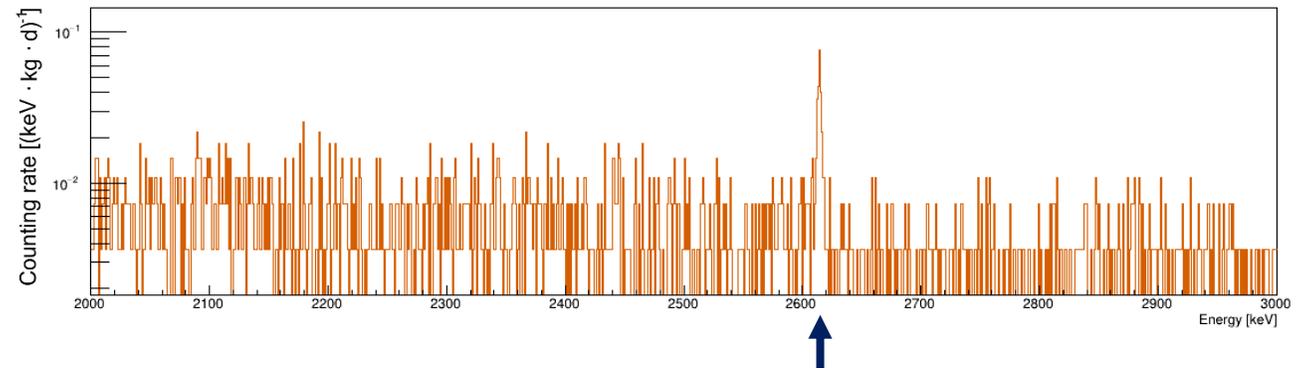

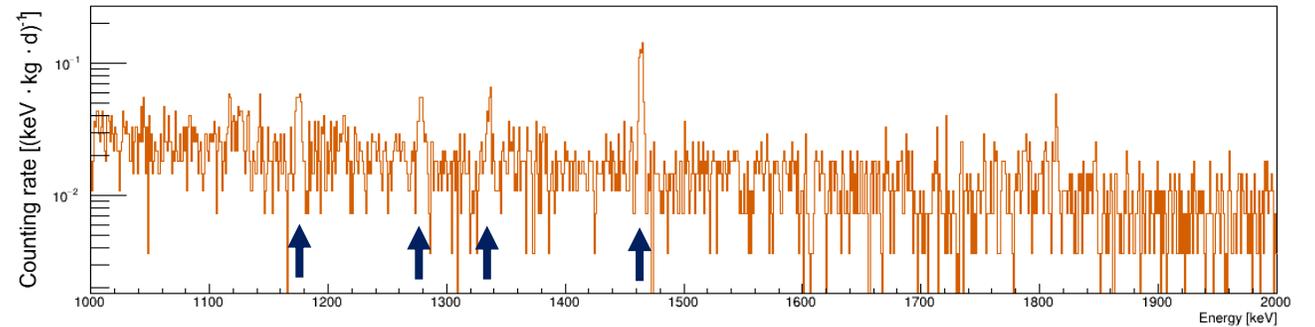

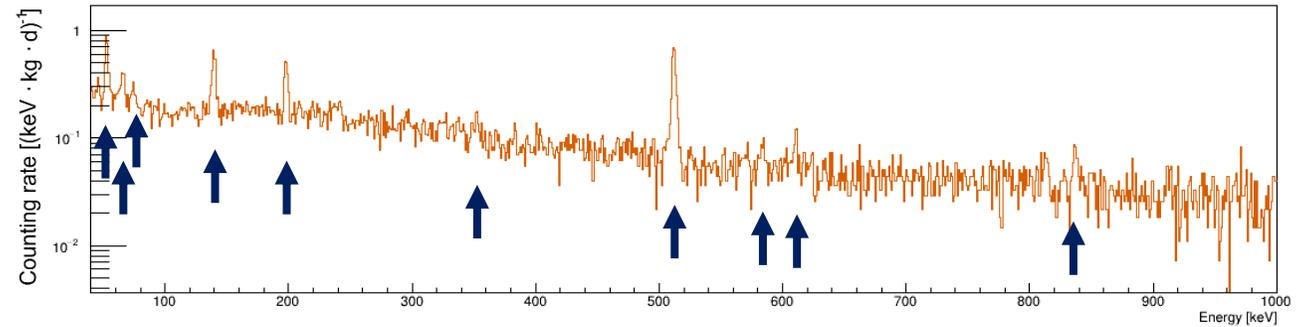

Integrated counting rate [40keV;2700keV]

- **Passive:** $R = 1982(3) \text{ kg}^{-1}\text{d}^{-1}$
- **Passive & active:** $R = 116(1) \text{ kg}^{-1}\text{d}^{-1}$

Veto efficiency of the active veto

- Efficiency: 99.52(19) %

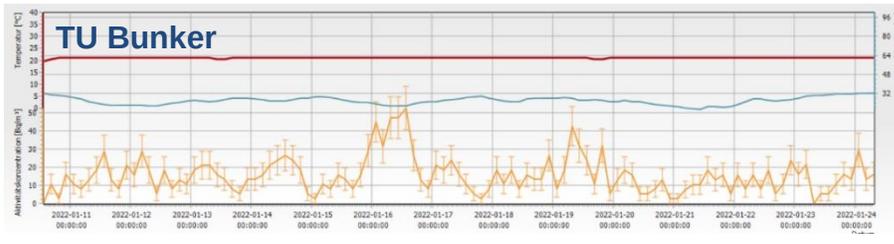

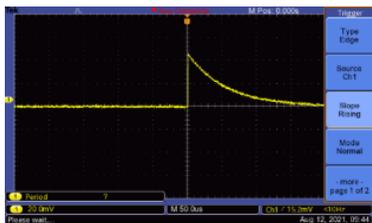

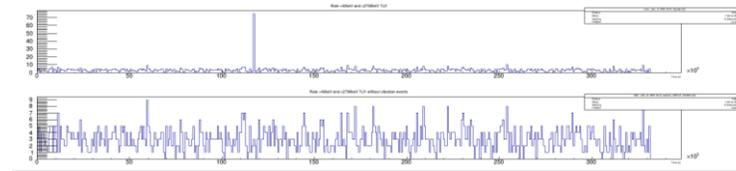

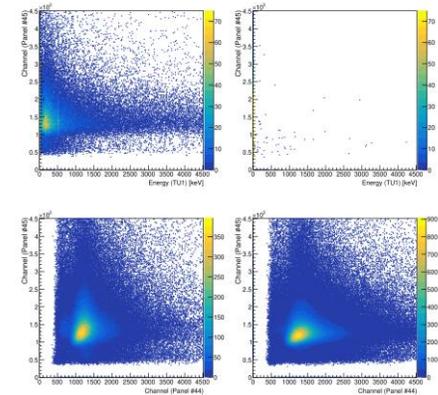

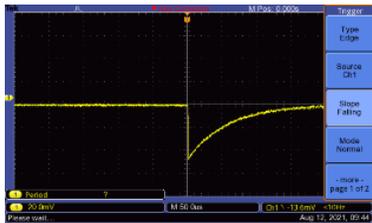

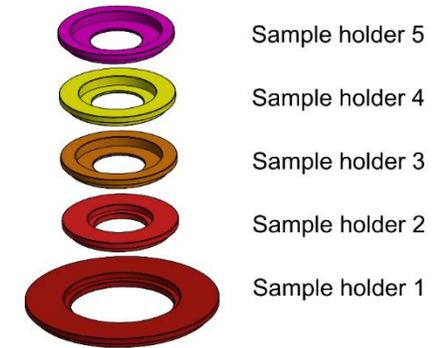

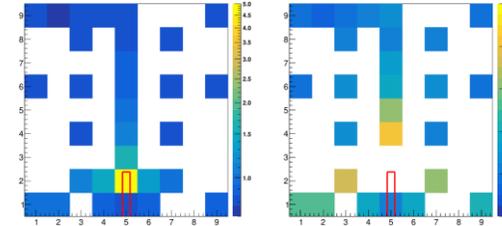

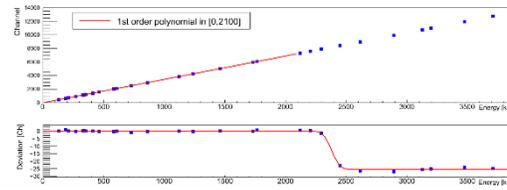

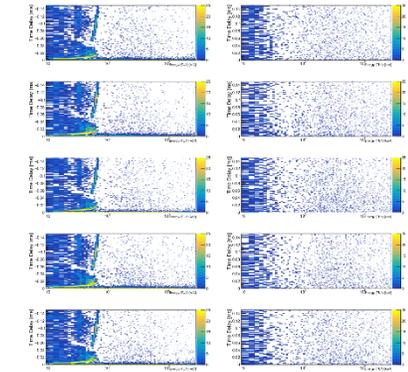

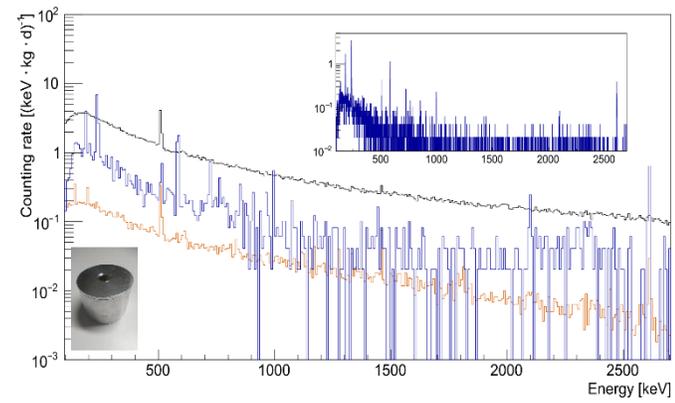

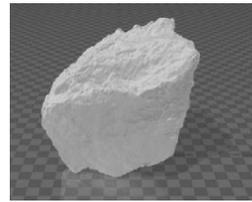

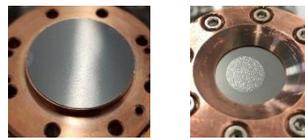

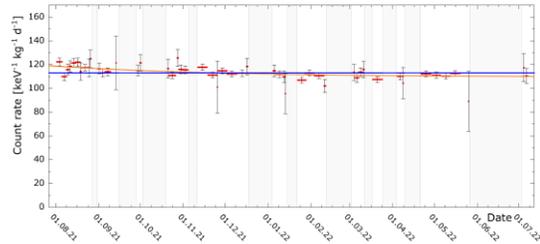

Energy [keV]	Nuclide	Origin	Rate [$\text{kg}^{-1}\text{d}^{-1}$]
52.0-55.6	^{73}mGe	$^{72}\text{Ge}(n,\gamma), ^{74}\text{Ge}(n,2n)$	1.28(19)
63.9-66.7	^{73}mGe	$^{72}\text{Ge}(n,\gamma), ^{74}\text{Ge}(n,2n)$	0.38(17)
72.8-75.0	Pb X	Lead K_α & K_β X-rays	0.33(12)
139.7	^{75}mGe	$^{74}\text{Ge}(n,\gamma), ^{76}\text{Ge}(n,2n)$	1.34(16)
198.4	^{71}mGe	$^{70}\text{Ge}(n,\gamma), ^{72}\text{Ge}(n,2n)$	1.00(15)
351.9	^{214}Pb	^{238}U decay chain	0.29(11)
511	e^+e^-	Annihilation	2.64(13)
583.2	^{208}Tl	^{232}Th decay chain	0.14(8)
609.3	^{214}Bi	^{238}U decay chain	0.21(8)
834.8	^{54}Mn	$^{54}\text{Fe}(n,p)^{54}\text{Mn}$	0.17(7)
1173.2	^{60}Co	$^{63}\text{Cu}(n,\alpha)^{60}\text{Co}$	0.18(5)
1274.5	^{22}Na	Lab-specific nuclide	0.20(5)
1332.5	^{60}Co	$^{63}\text{Cu}(n,\alpha)^{60}\text{Co}$	0.16(5)
1460.8	^{40}K	Natural radioactivity	0.49(6)
2614.5	^{208}Tl	^{232}Th decay chain	0.22(4)

Impression of the beauty of TU1

Michèle H. & Daniel B.

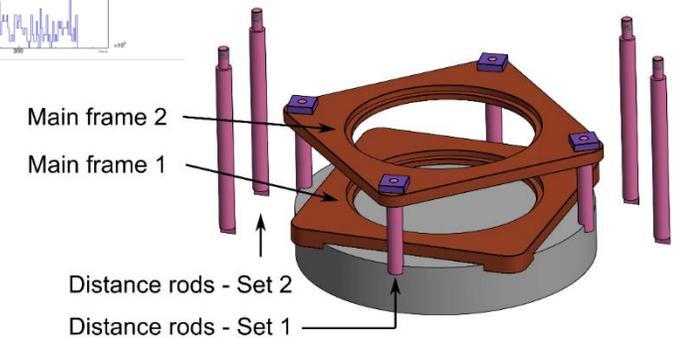

Dead time calculation of TU1

$$DT = 1 - \frac{OC + U + S}{IC}$$

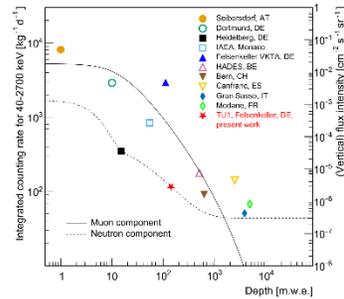

$IC = OC + S + \text{Pileup} + \text{Poissonian Events}$

- Poissonian Events
 - Lost during trigger
 - Lost during saturation
- Iterative procedure
 - Guess poisson events
 - Calculate ICR
 - Guess poisson events
- Why so complicated?

DT: Dead time
 OC: Output Counts
 IC: Input Counts
 U: Discarded events selected by user
 S: Saturated events

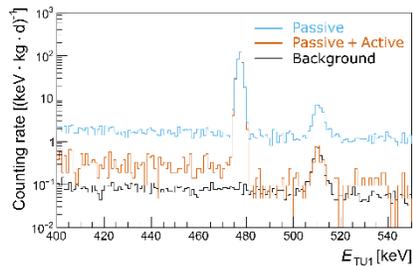

Summary & Outlook

The new TU1 detector

→ Unprecedented counting rates for non-deep underground labs

Active Veto

→ The power of offline optimization

Outlook

→ **Upcoming publication in *Astroparticle Physics***

→ TU1 is also highly interested in non-Dresden samples!!
